NIPPON COLUMBIA CO., LTD.

Please read carefully all safety and operating instructions before installation and use. It will help you to obtain the best performances from your new power amplifier.

FEATURES

- 1. **Changeable Multi-Channel Power Amplifier with Built-in Subwoofer Drive.**
 Maximum Power Output.
 6 Channel
 50W × 6 (1 kHz/4 ohms, 1% T.H.D.)
 45W × 6 (20 Hz~20 kHz/4 ohms, 0.1% T.H.D.)
 3 Channel
 100W × 3 (1 kHz/4 ohms, 1% T.H.D.)
- 2. **High-power Amplifier with MOS-FET.**
 With their high speed and favorable characteristics, MOS-FET devices are ideal for the powerstage of high-quality amplifiers.
- 3. **Variable Input Sensitivity.**
- 4. **Subwoofer Amplifier with Crossover Network.**
- 5. **Adjustable Subwoofer Level.**
 0 ~ +16 dB

- 6. **Ground Isolation Amplifier**
 Due to isolation of the ground in the amplifier, you can now enjoy hi-fi stereo in your car with a minimum of noise or distortion.
- 7. **Remote Power On/Off.**
 Now you can remotely control amplifier On/Off switching by just turning on the indash player. Since there is no longer any need to switch the amp individually, you may place it anywhere in the car, whether within or beyond reach.
- 8. **Pulse Regulated Power Supply.**
- 9. **DC-DC Converter with Soft-start Circuit.**
- 10. **Built-in Protector.**
- 11. **Convenient Power Indicator**
- 12. **Forced Cooling with Built-in Low-noise Fan.**
- 13. **Gold-Plated Connectors (RCA input, Speaker terminal, DC Power terminal)**

INSTALLATION

Due to the high power of this unit, DENON Power Amplifier needs adequate ventilation, so please find a safe position, on the floor or trunk, and install securely with self-tapping screws. (Fig. 1)

Avoid any locations in where the adequate ventilation and the highest performances could not be obtained as follows.

- 1) Near the vent of heater.
- 2) The location which allows the unit to be exposed to the sun.
- 3) Closed location such as inside the glove box or under the carpet.
- 4) The floor near doors or windows which would expose the unit to rain or moisture.
- 5) Near the pedals of driver which would interfere with operation of vehicle.
- 6) Weak and instable position which cannot support the heavy weight of the unit.

** Remove the ground cable (-) from the battery before installation to prevent damage to unit or the automobile's electrical system by miss-connection.

If the unit cannot be installed securely by self-tapping screws, use bolts, washers and nuts. (Fig. 2)

Accessories

DCA-800	Q'ty
Tapping Screw (1) 4 × 16	4

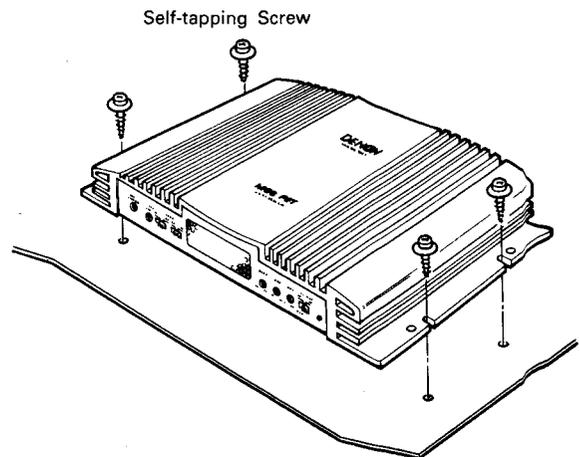

Fig. 1: On the floor or trunk

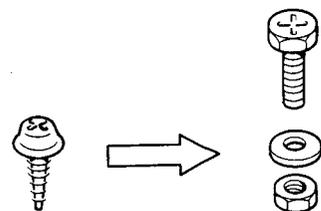

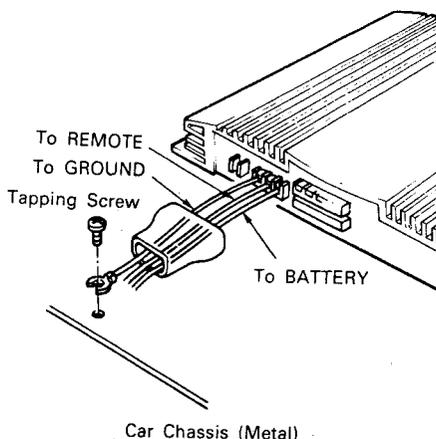

Fig. 2

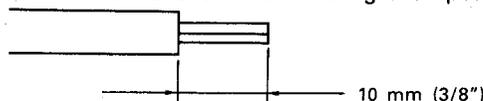

CONNECTIONS & OPERATION

After the DENON Power Amplifier DCA-800 is securely installed, make the connections as follows.

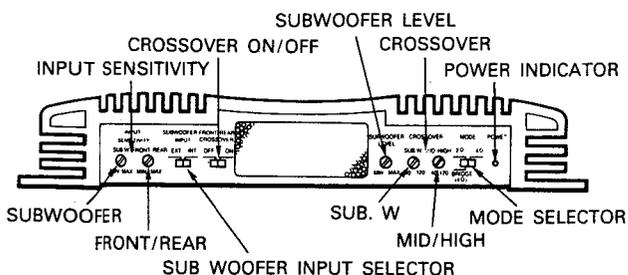

- 1) Connect the pre-out from your component to the input of DCA-800
 - 2) Connect the speaker wires to the speaker terminals of DCA-800.
 - * Make sure the polarity of left and right speaker line is observed.
 - * Never connect the speaker wirers of each speaker together.
 - * Never make the plus and minus wire short-circuit.
 - * Never connect the speaker wirers to the car chassis.
 - 3) Secure the ground wire to a clean bare metal spot on the car chassis. Make sure paint or coating is scraped away for best connection.
(The wire gauge should be 10~12 AWG.)
 - 4) Connect the remote cord to the remote control terminal of your indash player.
(The wire gauge should be 18 AWG.)
 - 5) Connect the battery cord directly to the positive (+) terminal of battery.
(The wire gauge should be 10~12AWG.)
- * Make all connections securely to prevent noise. Bind up the cords by tape after connection.
 - * Confirm again that your connection follows this instruction manual, re-install the parts of your automobile as they were and re-connect the negative (-) cable to the negative (-) terminal of the battery.
 - * If your indash player does not have a remote terminal, consult your DENON Dealer for alternate hook up.

Put the wire through the terminal cover, as shown on the diagram above. Allow about 10mm extra wire for attaching to the DC power terminal and speaker terminal block. (Refer to Page 9 for instructions on connecting the speakers.)

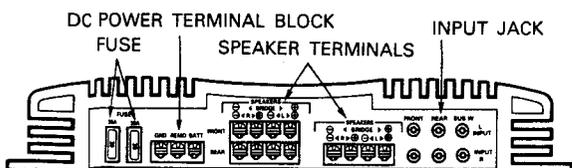

NOTE: Once the wire is connected to the speaker's DC power terminal block, press in the terminal cover as shown on the diagram below.

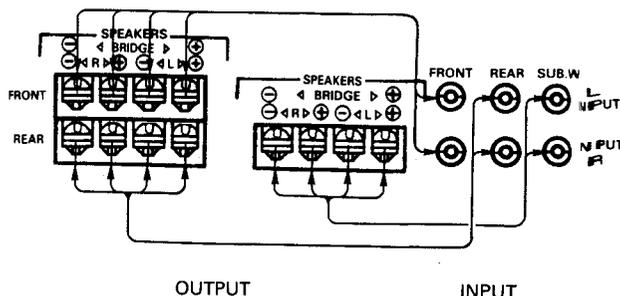

Please use the optional cord kit AK-110 or AK-140, available from your dealer.

	AK-110	AK-140
2P RCA PIN-PIN CORD	1.5 m	5 m (GOLD PLATE)
BATTERY CORD	2 m	6 m
REMOTE CORD	1.5 m	5 m
Y TYPE REMOTE CORD	0.1 m	0.1 m

CONFIGURATION OF INPUTS AND OUTPUTS

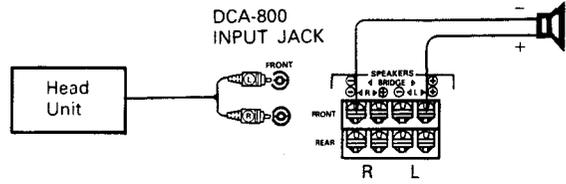

1. Stereo mode

- Connect the pre-out jacks on your component to the left and right input jacks on the DCA-800. Also, connect the left and right speaker wires, following the above notes.
- Set the mode selector to the 2 ohms or 4 ohms position, depending on the impedance of the speakers.

NOTE: If the mode selector is set to the 4 ohms position and a 2 ohms load is used (2 ohms speakers or 4 ohms speakers connected in parallel), the sound may be cut off when playing for long periods of time at high temperatures or with a high output. This is not a malfunction — the amplifier's high temperature protection circuit has been activated. If this happens, either turn the volume down or switch the mode selector to the 2 ohms position.

2. Mono mode

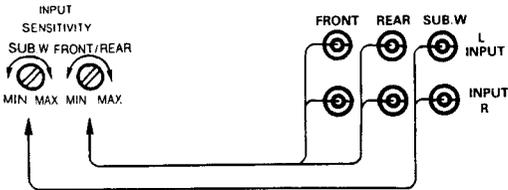

- Set the mode selector to the 2 ohms position.
- Use speakers with an impedance of 4 ohms or greater.

NOTE: The above procedure for using the stereo mode and mono mode applies to both the front and rear subwoofers.

If using the mono mode on even one of the six channels, set the mode selector to the 2-ohm position (bridge).

INPUT SENSITIVITY

The diagram below illustrates which inputs the INPUT SENSITIVITY act upon.

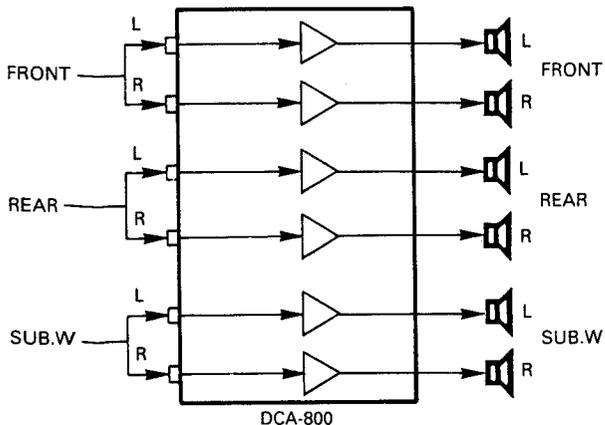

The sensitivity increases as the control is turned clockwise.

SUBWOOFER INPUT SELECTOR

This selector switches between the EXT and INT signals which are input to the subwoofer channel.

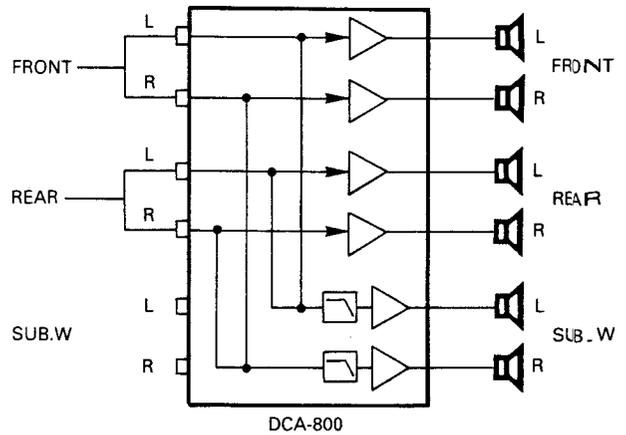

• When EXT is Selected

When the selector has been set to EXT, the signal connected to the DCA-800 subwoofer input terminals is input as the subwoofer signal.

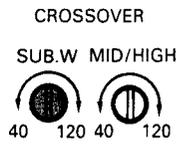

• When INT is Selected

When the selector has been set to INT, the left channel signal, which is input to the front and rear channels of the DCA-800, is input to the left channel of the subwoofer. Similarly, the right channel signal, which is input to the front and rear channels of the DCA-800, is input to the right channel of the subwoofer.

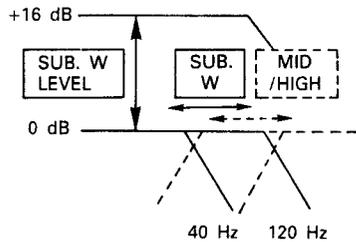

As shown on the diagram above, the internal subwoofer filter (low-pass filter) acts on the subwoofer signal. The cut-off for this filter is adjusted with the variable resistor shown on the following diagram.

Turning the SUB.W control all the way in the counterclockwise direction provides a cut off of 40 Hz. Turning the control all the way in the clockwise direction set the cut off to 120 Hz. Any setting between these values can be set.

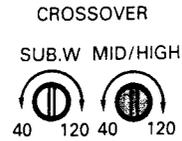

In addition, this signal can be boosted with the subwoofer level control. When turned fully clockwise the signal is boosted +16dB, and when turned fully counterclockwise the signal is boosted 0dB.

— Subwoofer signal
 - - - Front/rear signal

CROSSOVER ON/OFF

This switch applies the crossover filter (HIGH PASS) to the signals which are output from the 4 channels of the front and rear.

Turning the MID/HIGH control all the way in the counterclockwise direction provides a cut off of 40 Hz. Turning the control all the way in the clockwise direction set the cut off to 120 Hz. Any setting between these values can be set.

CAUTION:

The crossover can be turned on and off regardless of the position of the subwoofer input selector (INT or EXT).

Design and Specifications are subject to change for improvement without prior notice.

PRECAUTIONS

1. DENON Power Amplifier DCA-800 is only available for use in negative (-) ground automobiles. It cannot be used on positive (+) ground automobiles.
2. DENON Power Amplifier DCA-800 will operate properly with 14.4 V (11 V ~ 16 V) car batteries. You cannot use it on 24 V or other types of car batteries.
3. To reduce the risk of electric shock, do not remove the cover. No user serviceable parts inside. Refer servicing to qualified service personnel.
4. Do not allow any liquid or small objects to get inside the unit.
5. Please keep the warranty and the instruction manual for your further reference.

FOR YOUR RECORDS

Please record the serial number of your unit in the space provided below and keep it as a permanent record. The serial number is indicated on the bottom of the unit.

You will need the serial number, if the need for service should arise.

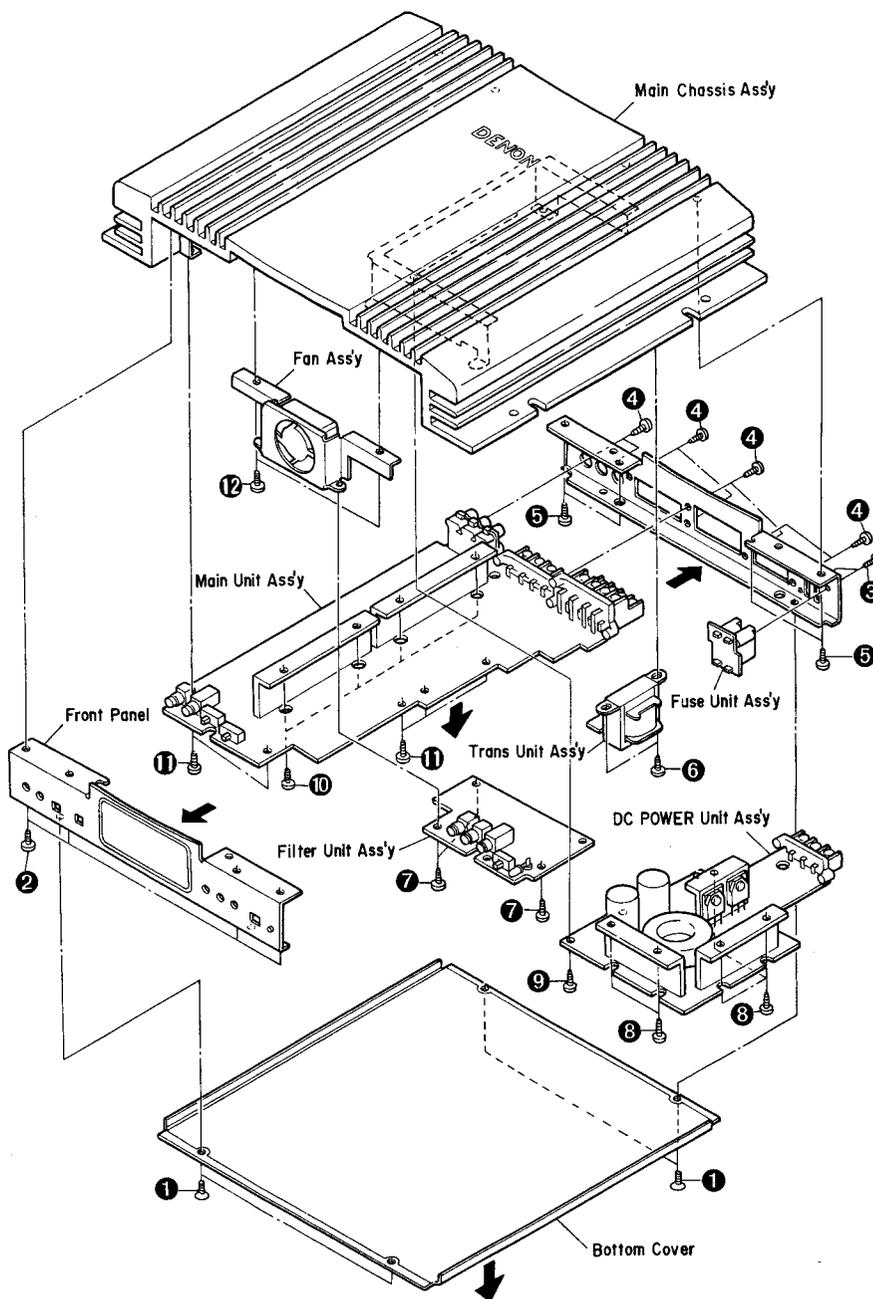

Model DCA-800

Serial Number _____

REMOVAL OF EACH SECTION

- (1) Remove 4 tapping screws ① out of Bottom Cover, and remove Bottom Cover as arrow shows.
- (2) Remove 4 bind screws ②, and remove Front Panel as arrow shows.
- (3) Remove 8 bind screws ④, and remove 4 bind screws ⑤.
- (4) Remove 2 pan screws ③, and remove Fuse Unit Ass'y, then remove Rear Panel as arrow shows.
- (5) Remove 2 bind screws ⑥, then remove Trans Unit Ass'y.
- (6) Remove 3 bind screws ⑦, then remove Filter Unit Ass'y.
- (7) Remove 5 bind screws ⑧ and 8 bind screws ⑨, then remove DC Power Unit Ass'y.
- (8) Remove 4 bind screws ⑩ and 7 bind screws ⑪, then remove Main Unit Ass'y.
- (9) Remove 2 bind screws ⑫, then remove Fan Ass'y.

Note:
Assemble each unit in reverse order of the disassembly procedure.

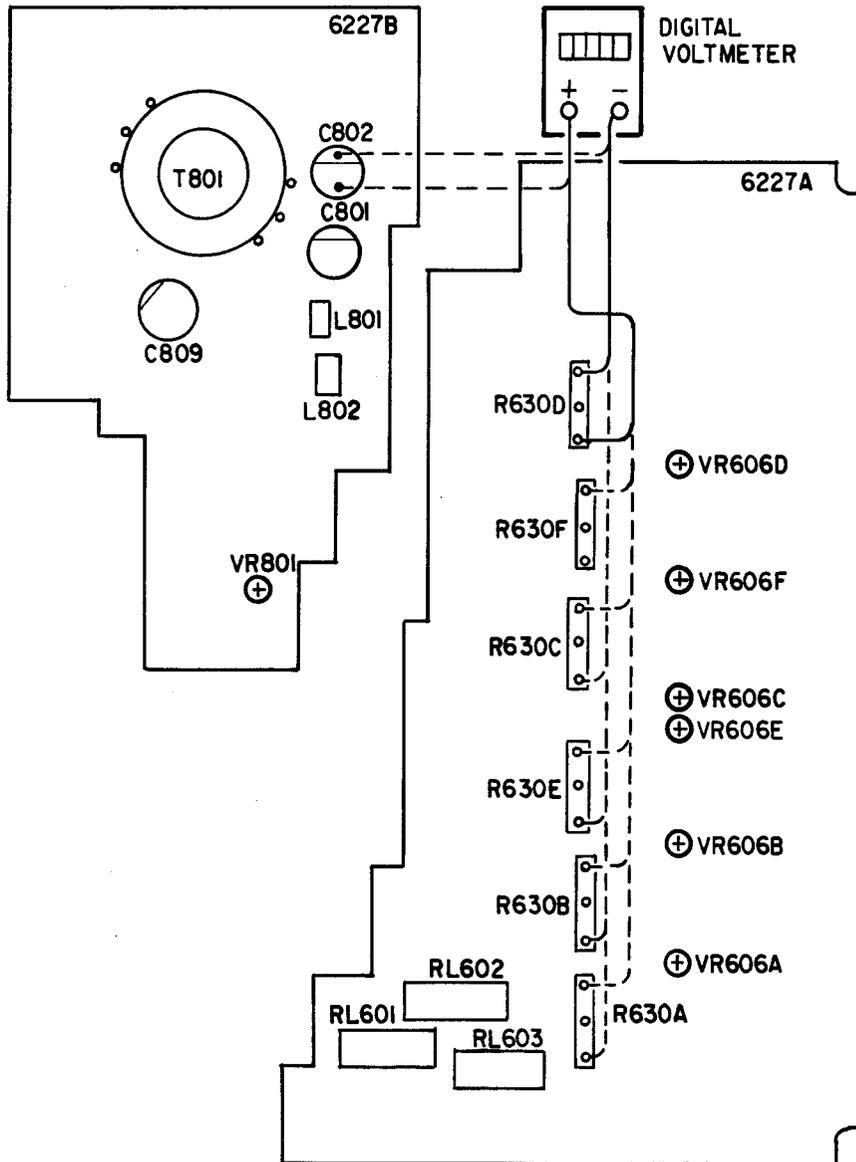

METHOD OF ADJUSTMENT

When making adjustments, be sure the power supply is at the rated voltage and the room air is in normal condition with respect to temperature and humidity.

Secondary Voltage Adjustment

Adjust VR801 so that the voltage across the both ends of C802 reads 23.4 ± 0.2 V in case 4 ohms STEREO MODE, ACC 14.4 V, No-signal mode.

Idling Current Adjustment

Under the state of power voltage 14.4 V and no load, connect DIGITAL VOLTMETER to R630A, 630B, 630C, 630D, 630E, 630F (0.15Ω × 2) as per the above Figure, within 30 ~ 40 seconds after turning power on, adjust VR606A, B, C, D, E, F so that the voltage across the both ends of the resistor is read 3 mV ~ 15 mV (10 mA ~ 50 mA).

CIRCUIT DESCRIPTION

1. AUDIO SECTION

① FET Input, FET Output

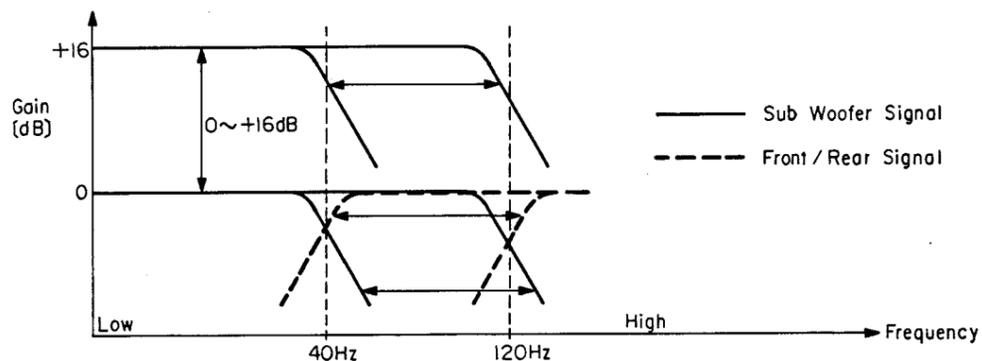

DCA-800 newly employs an operation amplifier which is a J-FET input type accommodating high-through rate digital source in the input first stage of IC601, 602, 603. Also, in the output stage, employs a durable, highly reliable MOS FET which permits high-output sound reproduction having a high-steepened, high-graded quality.

② Sub-woofer

A sub-woofer signal is feasible by using VR603 to boost within the range of 0 ~ +16 dB to make balancing with the other channels when sub-woofer input selector SW601 is set at INT. Also, this signal is processed with a -18 dB/Oct low-pass filter composed of IC606. The filter's cut-off frequency is continuously variable within the range of 40 Hz ~ 120 Hz by VR604. (Fig. 1)

③ Crossover Circuit

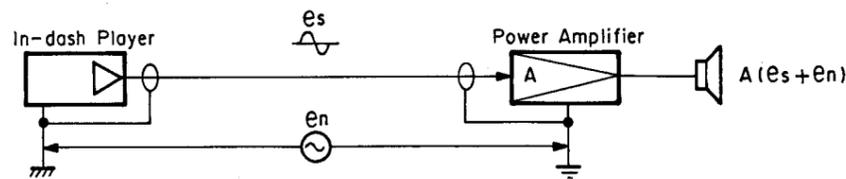

An input signal applied to the front and rear channels can be processed with a -12 dB/Oct high-pass filter which is composed of IC607, 608 by using SW602 at need. The filter's cut-off frequency is continuously variable within the range of 40Hz ~ 120 Hz by VR605. (Fig. 1)

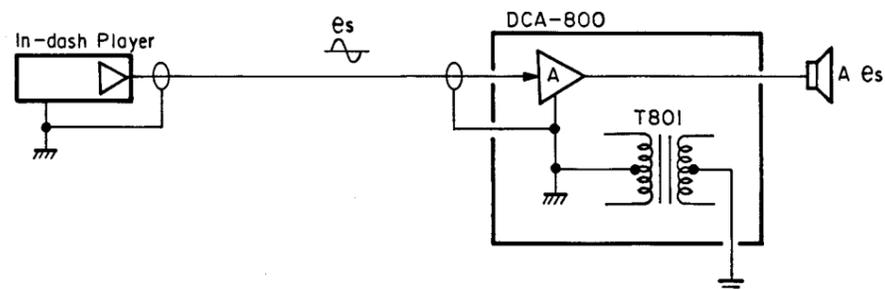

Also, the independence of SW601 and SW602 permits separate controlling of functions ② and ③.

④ Grounding Isolation

As a problem of amplifier to be used for car, the grounding position difference between the amplifier and the in-dash player to be connected invites engine noise(en) overlap in the input signal.

Upon this, for DCA-800, the primary side and secondary side of power supply ground are isolated and the secondary side ground i.e. audio ground to the in-dash player is connected to solve this problem. (Fig. 2)

2. POWER SUPPLY SECTION

① Switching Regulator Controlling Circuit

IC801 (μPC494C) is an IC for switching regulator for control of DC-DC converter circuit.

The pulse switching DC-DC converter circuit is output from No. 9 and No. 10 terminals, and is adopting the Fixed Frequency Pulse Width Modulation Method.

When REMOTE turns ON, causing TR818, 819 turn ON and the Pin ⑫ is supplied to the power. Upon the power supplied, the standard voltage (5V) which is built in IC801 emits from Pin ⑭ and impressed to Pin ④ through C808. After that, the voltage at Pin ④ gradually reduces voltage to ground level with the time constant of C808, R817, however, with this effects, the pulse width emitted from the Pins ⑨, ⑩ of IC801 gradually expands.

Accordingly, occurring of rush-current caused by the steep rise of power at REMOTE ON will be prevented. (Soft start)

This number of frequency is determined by C817 and R839.

Voltage fluctuation on the secondary side of DC-DC converter caused by changes of power voltage and load is captured as a current change of photo-coupler (IC802), and the pulse width is changed by feedback of current change to No. 10 terminal via VR801, thus the secondary voltage will be controlled.

② Toroidal Transformer

T801 of this unit is adopting a small, highly efficient toroidal transformer and therefore the stable power voltage can be supplied at the time the output power is high.

3. COOLING FAN

A cooling fan is newly employed to this unit. This fan starts running when the heat sink temperature becomes approx. 70°C to lower the temperature inside of the unit, thus each part of amplifier can perform stable functions.

4. PROTECTOR CIRCUIT

① Protection of Speaker

IC614 (μPC1237) searches various abnormalities and executes protective operations.

● Overload Censoring

When shortcircuit or overload of speaker terminals occurs, current at (R630A (B, C, D, E, F) increases causing voltage rise of this resistance, and TR606A (B, C, D, E, F) turns ON. After this, due to turning ON of TR608, voltage at No. 6 terminal of IC614 increases by approximately 24V, and relay (RL601) turns OFF and separates the speaker from the amplifier.

● DC Voltage Sensoring

Speaker terminal voltage is normally approximately 0V (DC). However, when DC voltage comes out due to some accident, the speaker is separated to prevent from breakage or burning damage.

If DC voltage appears on the speaker terminal, it will be added to No. 2 terminal of IC614, and the voltage at No. 6 terminal is raised up to approximately 24V, thus the relay (RL601, 602, 603) turns OFF.

● Acc OFF Sensoring

Acc voltage is sensorate via R643, ZD605 which are connected to No. 4 terminal of IC606, and the relay (RL601, 602, 603) rapidly turns OFF as soon as Acc becomes OFF.

② Thermal Protection

When temperature inside the unit rises, resistance of thermistor (TH802) is weakened and TR802 becomes ON, then IC801 stops. In case of abnormal high temperature, resonance of IC801 stops and then DC-DC converter circuit will be closed.

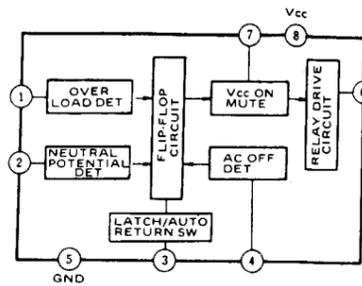

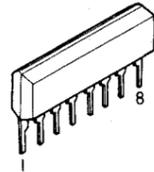

③ Protection Against at Excess of Primary Voltage

If a 16V or higher voltage applies to the battery terminal should happen, the voltage is impressed to TR817 via ZD801, R841 and TR817, 816 make conduct. Then, IC801 stops the output to protect against abnormal rise of the secondary side voltage and breakdown.

PRINTED WIRING BOARD PARTS LIST

NOTE FOR PARTS LIST

- Part indicated with the mark "⊙" are not always in stock and possibly to take a long period of time for supplying, or in some case supplying of part may be refused.
- When ordering of part, clearly indicate "1" and "1" (i) to avoid mis-supplying.
- Ordering part without stating its part number can not be supplied.
- Part indicated with the mark "★" is not illustrated in the exploded view.
- Not including Carbon Film ±5%, 1/4W Type in the P.W.Board parts list. (Refer to the Schematic Diagram for those parts.)

WARNING:
Parts marked with this symbol  have critical characteristics.
Use ONLY replacement parts recommended by the manufacturer.

NOTE FOR PARTS LIST

- Part indicated with the mark " ⊙ " are not always in stock and possibly to take a long period of time for supplying, or in some case supplying of part may be refused.
- When ordering of part, clearly indicate "1" and "1" (i) to avoid mis-supplying.
- Ordering part without stating its part number can not be supplied.
- Part indicated with the mark "★" is not illustrated in the exploded view.

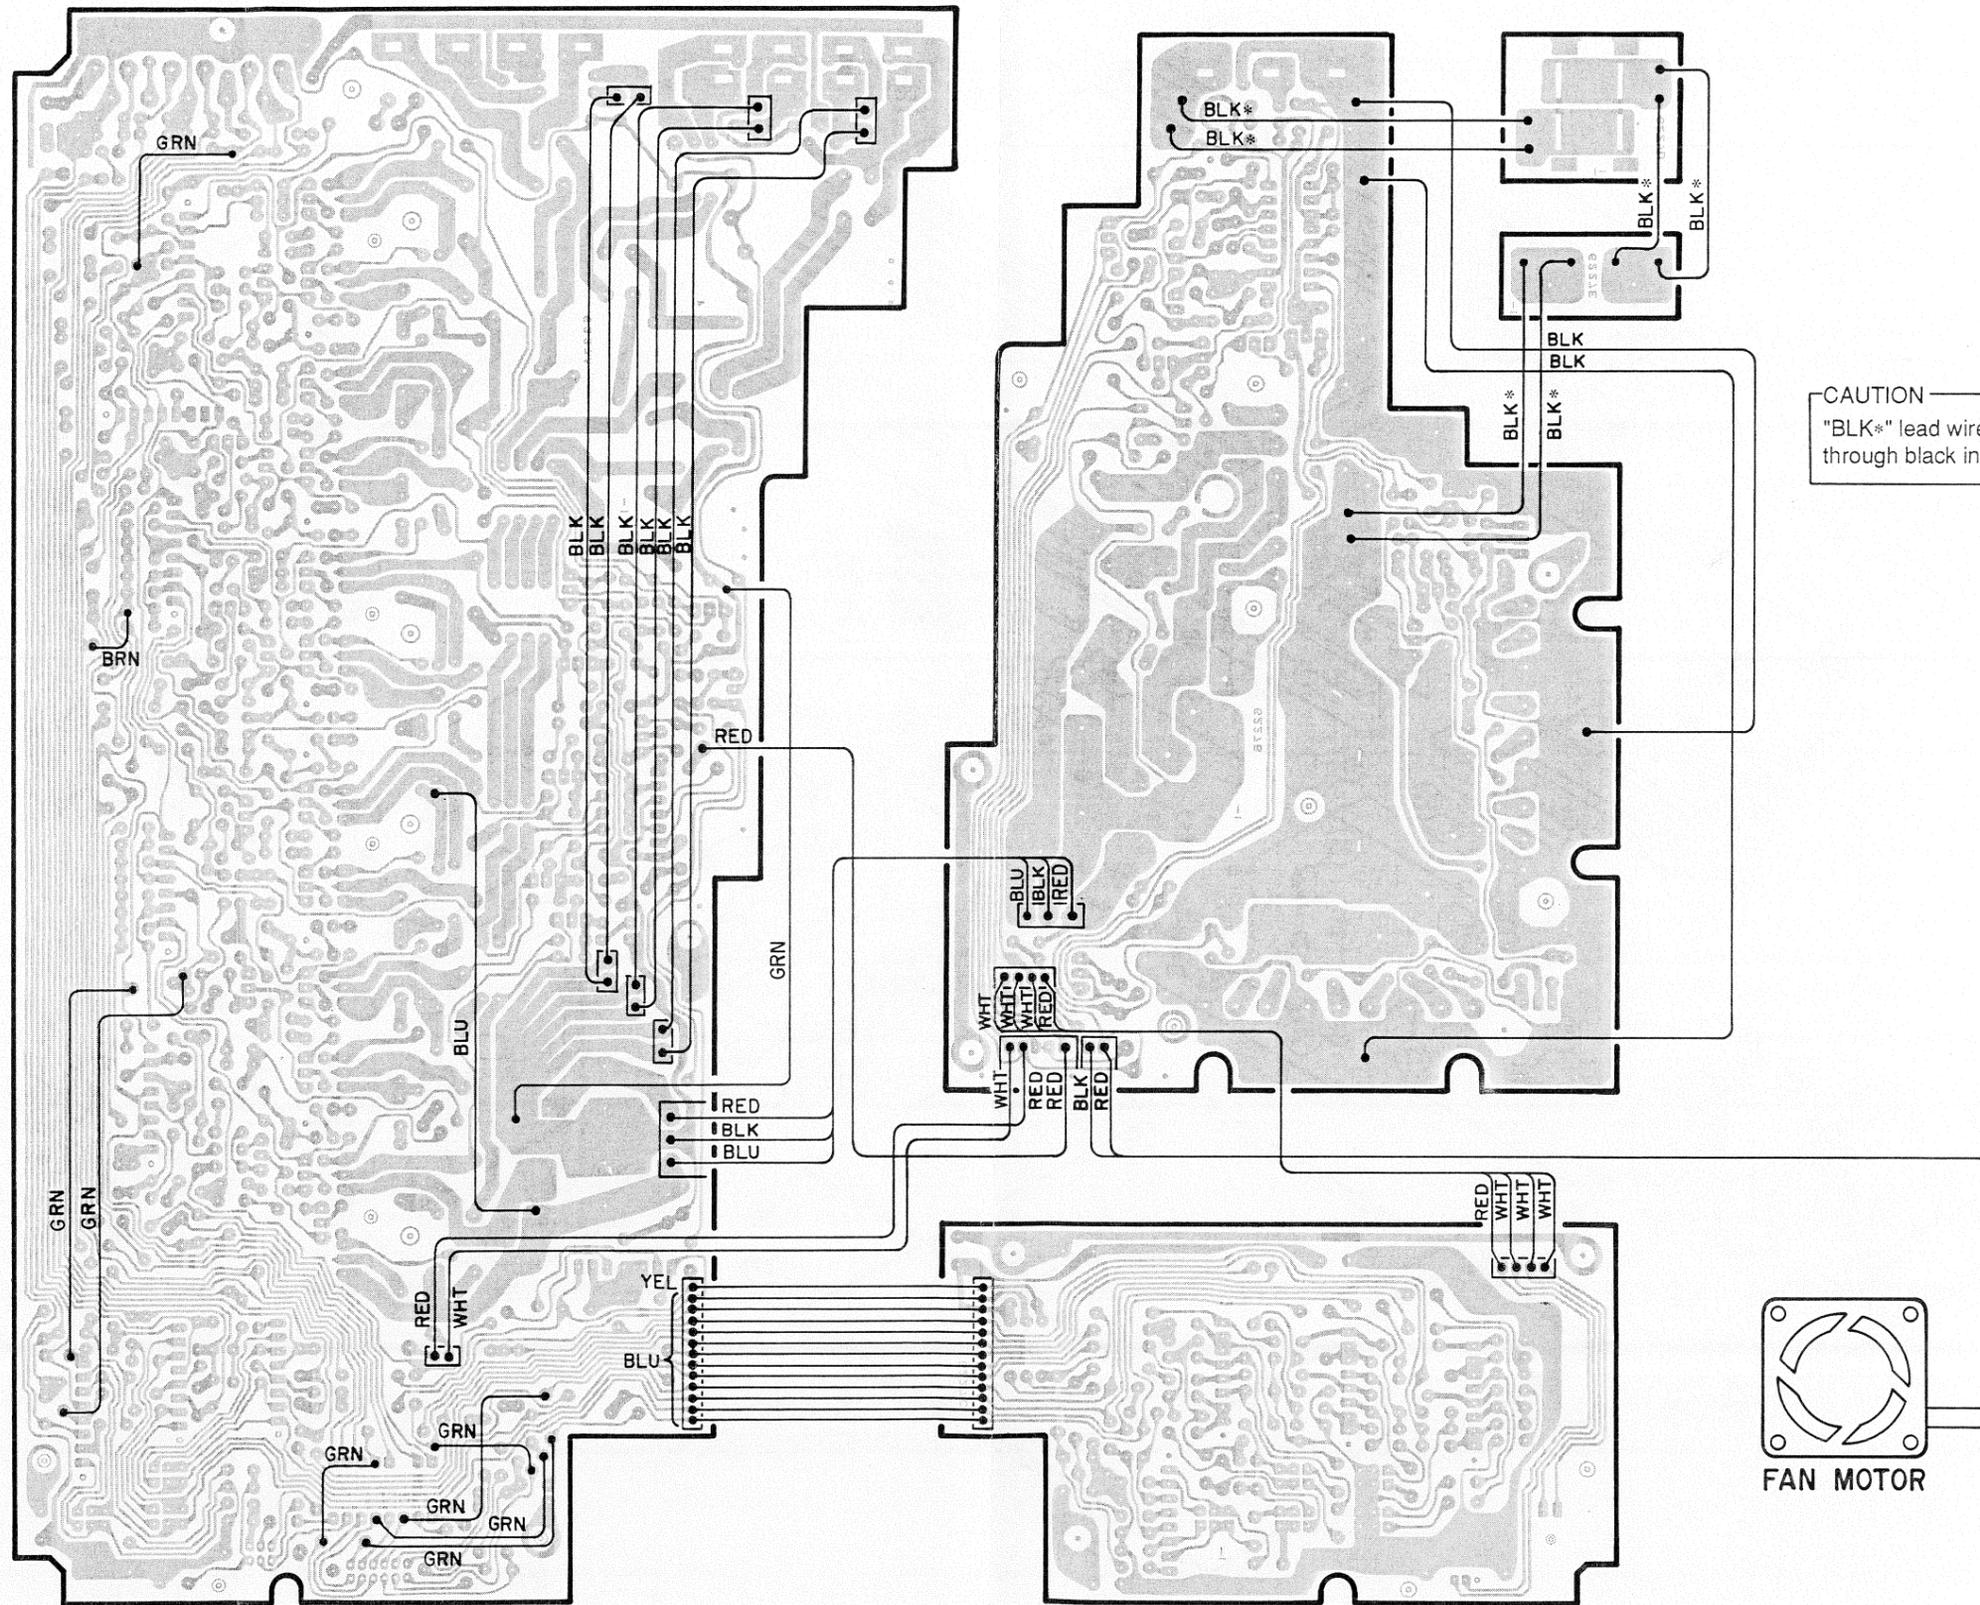

WARNING:

Parts marked with this symbol △ have critical characteristics.
Use ONLY replacement parts recommended by the manufacturer.
